The rigid geometry predicts face/loft coupling for these stated club setups. Quadrants are simulated endpoint frequencies conditional on supported shots; they do not identify a closed-face mechanism or establish that left shots travel longer. Path, strike, speed and spin can also change the outcome.

Absolute Scoring

Absolute SG is a conditional simulated endpoint score against a historical-tour baseline. Driver tee and iron/wedge approach contexts are different opportunities. The absolute SG mean uses the common three-pattern intersection; individual endpoint support can be larger. No values here are measured player strokes gained or per-round effects.
